

FREE COOLING INTRODUCED IN FIXED NET DATA ROOMS

When a German fixed net service provider needed to lower energy consumption in his overall business, a thorough investigation process took its beginning. Against the back-ground of the results, as well as recommendations from colleagues in the business, Dantherm was chosen as the customer's preferred business partner.

Free cooling solution

After site visits in Sweden and an on-site temperature measurement carried out by Dantherm, the customer chose a Dantherm Free Cooling solution, theFlexibox 450. Using free cooling instead of active cooling, this solution would lead to significant energy savings.

Support and assistance

Dantherm assisted in the test installation phase on site and provided recommendations and support for introduction of free cooling at remaining sites. Dantherm also showed flexibility in the after sales process, when the customer wished to test the temperature compensation feature, which was retrofitted.

Customer satisfaction

The customer found delivery to be prompt and assistance in the installation process professional. The installation and operation of the test unit was easy, and the customer is now working progressively to introduce free cooling at both existing and new sites.
