

# External ON/OFF temperature control of water cooled condenser in CDP 75 – 125 – 165 pool dehumidifiers

Typically a water cooled condenser is used when the additional heat supply from the dehumidification process is undesirable.

In such cases a water cooled condenser can be used to utilize the heat to warm up the pool water (or the tap water).

Use a controller with input signal to thermostat Th to activate solenoid valve and also start the pump.
